

# Statement of Verification

BREG EN EPD No.: 000266 Issue 05

This is to verify that the

**Environmental Product Declaration** provided by:

Hamriyah Steel FZC (member of UK CARES)

is in accordance with the requirements of:

EN 15804:2012+A2:2019

and

**BRE Global Scheme Document SD207** 

This declaration is for:

Carbon Steel Reinforcing Bar (Direct Reduced Iron production route)

# **Company Address**

Hamriyah Free Zone Phase 2 Sharjah PO Box 42142 United Arab Emirates

Emma Baker

Operator

09 June 2023

15 May 2026 Expiry Date

20 June 2019

This Statement of Verification is issued subject to terms and conditions (for details visit  $\underline{www.greenbooklive.com/terms}.$ 

To check the validity of this statement of verification please, visit  $\underline{www.greenbooklive.com/check}\ or\ contact\ us.$

# Comparability

a: Product category rules b: Optional for business-to-business communication; mandatory for business-to-consumer communication (see EN ISO 14025:2010, 9.4)

Environmental product declarations from different programmes may not be comparable if not compliant with EN 15804:2012+A2:2019. Comparability is further dependent on the specific product category rules, system boundaries and allocations, and background data sources. See Clause 5.3 of EN 15804:2012+A2:2019 for further guidance

# **Manufacturing site**

Hamriyah Steel FZC (member of UK CARES)

Hamriyah Free Zone Phase 2 Sharjah PO Box 42142 United Arab Emirates

# **Construction Product:**

# **Product Description**

Reinforcing Steel Bar (according to product standards listed in Sources of Additional Information) that is obtained from Direct Reduced Iron (DRI), melted in an Electric Arc Furnace (EAF) followed by hot rolling.

The declared unit is 1 tonne of carbon steel reinforcing bars as used within concrete structures for a commercial building.

# **Technical Information**

Property	Value, Unit
Production route	EAF
Density	7850 kg/m³
Modulus of elasticity	200000 N/mm <sup>2</sup>
Weldability (Ceq)	max 0.50 %
Yield strength (as per BS 4449:2005+A3:2016)	min 500 N/mm <sup>2</sup> – max 650 N/mm <sup>2</sup>
Tensile strength (as per BS 4449:2005+A3:2016)	min 540 N/mm² (Tensile strength/Yield Strength ≥ 1.08)
Agt (% total elongation at maximum force as per BS 4449:2005+A3:2016)	min 5 %
Surface geometry (Relative rib area, fR as per BS 4449:2005+A3:2016)	min 0.040 for Bar Size >6mm & ≤12mm & min 0.056 for Bar size>12
Re-bend test (as per BS 4449:2005+A3:2016)	Pass
Fatigue test (as per BS 4449:2005)	Pass
Recycled content (as per ISO 14021:2016/Amd:2021)	11.3 %

# **Main Product Contents**

Material/Chemical Input	%
Fe	97
C, Mn, Si, V, Ni, Cu, Cr, Mo and others	3

# **Manufacturing Process**

Direct reduced iron (DRI) is produced as a first step from imported iron ore pellets. DRI is then melted in an Electric Arc Furnace (EAF) to obtain liquid metal. This is then refined to remove impurities and alloying additives can be added to give the required properties of the steel.

Hot metal (molten steel) from the EAF is then cast into steel billets/blooms/beam-blanks before being sent to the rolling mill where they are rolled and shaped to the required dimensions for the finished bars of reinforcing steel.

The products are packed with steel wire or straps to bind the products, either of the steel ties and products do not include any biogenic materials.

### **Process flow diagram**

#### **Construction Installation**

Processing and proper use of reinforcing steel products depends on the application and should be made in accordance with generally accepted practices, standards and manufacturing recommendations.

During transport and storage of reinforcing steel steel products the usual requirement for securing loads is to be observed.

### **Use Information**

The composition of the reinforcing steel products does not change during use.

Reinforcing steel products do not cause adverse health effects under normal conditions of use.

No risks to the environment and living organisms are known to result from the mechanical destruction of the reinforcing steel product itself.

#### **End of Life**

Reinforcing steel products are not reused at end of life but can be recycled to the same (or higher/lower) quality of steel depending upon the metallurgy and processing of the recycling route.

It is a high value resource, so efforts are made to recycle steel scrap rather than disposing of it at EoL. A recycling rate of 92% is typical for reinforcing reinforcing steel products

# **Life Cycle Assessment Calculation Rules**

# **Declared unit description**

The declared unit is 1 tonne of carbon steel reinforcing bars manufactured by the Direct Reduced Iron production route as used within concrete structures for a commercial building (i.e. 1 tonne in use, accounting for losses during fabrication and installation, not 1 tonne as produced)

# System boundary

The system boundary of the EPD follows the modular design defined by EN 15804+A2. This is a cradle to gate – with all options EPD and thus covers all modules from A1 to C4 and includes module D as well.

Impacts and aspects related to losses/wastage (i.e. production, transport and waste processing and end-of-life stage of lost waste products and materials) are considered in the modules in which the losses/wastage occur.

Once steel scrap has been collected for recycling it is considered to have reached the end of waste state.

# Data sources, quality and allocation

Data Sources: Manufacturing data of the period 01/01/2021-31/12/2021 has been provided by Hamriyah Steel FZC (member of UK CARES).

The selection of the background data for electricity generation is in line with the BRE Global PCR. Country or region specific power grid mixes are selected from GaBi 2021 databases (Sphera 2021); thus, consumption grid mix of UAE has been selected to suit specific manufacturing location.

Data Quality: Data quality can be described as good. Background data are consistently sourced from the GaBi 2021 databases (Sphera 2021). The primary data collection was thorough, considering all relevant flows and these data have been verified by UK CARES.

Data quality level and criteria of the UN Environment Global Guidance on LCA database development:

Geographical Representativeness : Good
Technical Representativeness : Very good
Time Representativeness : Good

Allocation: EAF slag and mill scale are produced as co-products from the steel manufacturing process. Impacts are allocated between the steel, the slag and the mill scale based on economic value. The revenue generated from mill scale is 0.09%, and it is less than 1% in relation to the product based on current market prices, this co-product is of definite value and is freely/readily traded in reality. For this reason, economic allocation has been applied to the processes where this co-product arise.

Production losses of steel during the production process are recycled in a closed loop offsetting the requirement for external scrap. Specific information on allocation within the background data is given in the GaBi datasets documentation (/GaBi 6 2021/)

#### **Cut-off criteria**

On the input side all flows entering the system and comprising more than 1% in total mass or contributing more than 1% to primary energy consumption are considered. All inputs used as well as all process-specific waste and process emissions were assessed. For this reason, material streams which were below 1% (by mass) were captured as well. In this manner the cut-off criteria according to the BRE guidelines are fulfilled.

The mass of steel wire or strand used for binding the product is less than 1 % of the total mass of the product.

# Scenarios and additional technical information

Scenarios and add	itional technical information						
Scenario	Parameter	Units	Results				
	On leaving the steelworks the reinforcing steel products are they are converted into constructional steel forms suitable for transported on to the construction site, including provision of transport distance for rolled steel to fabricators and road transport construction forms to site are assumed to be 100 km and 25 Only the one-way distance is considered as it is assumed the optimise their distribution and not return empty in modules be	or the installation sit f all materials and p nsport distance for 50 km, respectively. nat the logistics com	e, then products. Road steel				
A4 – Transport to the building site	Truck trailer - Fuel	litre/km	1.56				
	Distance	km	350				
	Capacity utilisation (incl. empty returns)	%	85				
	Bulk density of transported products	kg/m <sup>3</sup>	7850				
A5 – Installation in the building	The fabrication process is a relatively simple unit process and accounts for the transform of the rolled steel product into construction steel forms. The operations in this unit proces primarily cutting and welding. As such, other inputs to the process include electricity, the energy, and cutting gases. Other outputs of this process are steel scrap and wastewater (where applicable).  Fabrication into structural steel products and installation in the building; including provisic all materials, products, and energy, as well as waste processing up to the end-of-waste of disposal of final residues during the construction stage. Installation of the fabricated product the building is assumed to result in 10% wastage (determined based on typical installosses reported by the WRAP Net Waste Tool [WRAP 2017]). It is assumed that fabricat requires 15.34 kWh/tonne finished product, and that there is a 2% wastage associated we process.  Ancillary materials for installation - Waste material from fabrication, losses per tonne of construction steel forms  Energy Use - Energy per tonne required to fabricate construction steel forms						
	Waste materials from installation wastage	%	10				
B2 – Maintenance	No maintenance required						
B3 – Repair	No repair process required						
B4 – Replacement	No replacement considerations required						
B5 – Refurbishment	No refurbishment process required						
Reference service life	Reinforcing steel products are used in the main building structure so the reference service life will equal the lifetime of the building. The Concrete Society follows the definitions provided in BS EN 1990, which specifies "building structures and other common structures" as having a lifetime of 50 years (The Concrete Society, n.d.; BSI, 2005). On this basis, the RSL for this EPD is assumed to be 50 years.						
B6 – Use of energy; B7 – Use of water	No water or energy required during use stage related to the	operation of the bu	ilding				

C1 to C4 End of life,	The end-of-life stage starts when the construction product is replaced, dismantled or deconstructed from the building or construction works and does not provide any further function. The recovered steel is transported for recycling while a small portion is assumed to be unrecoverable and remains in the rubble which is sent to landfill. 92% of the reinforcing steel is assumed to be recycled and 8% is sent to landfill [STEELCONSTRUCTION.INFO 2012]. Once steel scrap is generated through the deconstruction activities on the demolition site it is considered to have reached the "end of waste" state. No further processing is required so there are no impacts associated with this module. Hence no impacts are reported in module C3.		
	Waste for recycling - Recovered steel from crushed concrete	%	92
	Waste for energy recovery - Energy recovery is not considered for this study as most end of life steel scrap is recycled, while the remainder is landfilled	-	-
	Waste for final disposal - Unrecoverable steel lost in crushed concrete and sent to landfill	%	8
	Portion of energy assigned to rebar from energy required to demolish building, per tonne	MJ	24
	Transport to waste processing by Truck - Fuel consumption	litre/km	1.56
	Transport to waste processing by Truck – Distance	km	463
	Transport to waste processing by Truck – Capacity utilisation	%	85
	Transport to waste processing by Truck – Density of Product	kg/m³	7850
	Transport to waste processing by Container ship - Fuel consumption	litre/km	0.0041
	Transport to waste processing by Container ship - Distance	km	158
	Transport to waste processing by Container ship – Capacity utilisation	%	50
	Transport to waste processing by Container ship – Density of Product	kg/m³	7850
Module D	It is assumed that 92% of the steel used in the structure is recovered for recycling, while the remainder is landfilled. "Benefits and loads beyond the system boundary" (module D) accounts for the environmental benefits and loads resulting from net steel scrap that is used as raw material in the EAF and that is collected for recycling at end of life. The balance between total scrap arisings recycled from fabrication, installation and end of life and scrap consumed by the manufacturing process (internally sourced scrap is not included in this calculation). These benefits and loads are calculated by including the burdens of recycling and the benefit of avoided primary production.  A large amount of net scrap is generated over the life cycle as the Direct Reduced Iron (DRI) production route is primarily from virgin sources and there is a very high end of life recycling rate for reinforcing steel products. As a result, module D reports the credits associated with the		
	scrap output.  The resulting scrap credit/burden is calculated based on the global "value of scrap" approach (/worldsteel 2011).		
	Recycled Content	kg	113
	Re-used Content	kg	0
	Recovered for recycling	kg	920
	Recovered for re-use	kg	0
	Recovered for energy	kg	0

# Summary, comments and additional information

### Interpretation

Direct Reduced Iron based reinforcing steel product of Hamriyah Steel FZC (member of UK CARES) is made via the EAF route. The bulk of the environmental impacts and primary energy demand is attributed to the manufacturing phase, covered by information modules A1-A3 of EN 15804+A2.

The interpretation of the results has been carried out considering the methodology- and data-related assumptions and limitations declared in the EPD. This interpretation section focuses on the environmental impact categories as well as the primary energy demand indicators only.

#### Global Warming Potential (GWP)

The majority of the life cycle GWP impact occurs in the production phase (A1-A3). A1-A3 impacts account for 88.41% overall life cycle impacts for this category. The most significant contributions to production phase impacts are: the upstream production of raw materials used in the steelmaking process, generation/supply of electricity and the production/use of fuels on site. Fabrication, installation and the end-of-life processes covered in C1-C4 make a minimal contribution to GWP. For overall climate change impacts, carbon dioxide emissions account for the majority of impacts with methane being the second most significant contributor.

#### Ozone Depletion Potential (ODP)

The majority of impacts are associated with the production phase (A1-3). Significant contributions to production phase impact come from the emission of ozone depleting substances during the upstream production of raw materials/preproducts as well as those arising from electricity production. Module D shows a very small credit even though scrap burdens are being assessed in this phase. This is explained because ODP emissions are linked to grid electricity production used.

### Acidification Potential (AP)

Acidification potential is generally driven by the production of sulphur dioxide and nitrogen oxides through the combustion of fossil fuels, particularly coal and crude oil products. The majority of the lifecycle AP impact occurs in the production phase (A1-A3), similar to GWP. The major contributors to production phase AP impacts comes from energy resources used in the production of the raw materials and pre-products for the steelmaking process and from transportation. Fabrication, installation and the end-of-life processes classed under C1-C4 make minimal contributions.

### Eutrophication Potential (EP)

Eutrophication is driven by nitrogen and phosphorus containing emissions and as with GWP and AP is often strongly linked with the use of fossil fuels. The major eutrophication impacts occur in the production phase (A1-A3). Significant contributions to production phase impact comes from the production of raw materials and transport. Fabrication, installation and the end-of-life processes classed under C1-C4 again make minimal contributions.

### Photochemical Ozone Creation Potential (POCP)

POCP tends to be driven by emissions of carbon monoxide, nitrogen oxides (NOx), sulphur dioxide and NMVOCs. The production phase is the dominant phase of the lifecycle with regards to POCP impacts. Again, these are all emissions commonly associated with the combustion of fuels. Significant contributors to POCP are the upstream production of raw materials/pre-products and transport, directly linked to fossil fuel combustion. It should be noted that the impacts for steel recycling in module D is almost of the same magnitude as the production phase impacts.

Figure 1 - shows the relative contribution of each life cycle stage to different environmental indicators for the carbon steel reinforcing bars manufactured by the Direct Reduced Iron production route
